

Statistics 8330
Homework 5
Due Monday April 27 by midnight

Conduct a simulation study comparing the performance of a basic decision tree, decision tree with pruning, random forest, and AdaBoost in classification. You can use the same simulation framework that you used for the classification simulation in the previous assignment and you should include a range of scenarios similar in scope to what was described in that problem. Write a report explaining your findings. The report should include appropriate figures and tables. You can do this in either R or Python.
